- Part of SoCG (International Symposium on Computational Geometry)
- 4th year, started in 2018
- Hard geometric optimization problems
- Different problem each year
- $\sim 200$  instances given
- $\sim 3$  months to compute solutions
- Send our solutions (not the code)
- Score based on the quality of the solutions
- Top teams invited to publish in SoCG proceedings and ACM Journal of Experimental Algorithmics
- This talk is about the 2022 competition, but let's look at previous years...

## Minimum (or Maximum) Area Polygon:

- Input: A set of points  $S \subset \mathbb{R}^2$
  - Output: A simple polygon with vertex set  $S$
  - Goal: Minimize (or maximize) the area
- 
- Related to Euclidean TSP
  - Two categories: minimization, maximization
  - We got 2nd place
  - Techniques: greedy and local search

## Minimum Convex Partition:

- Input: A set of points  $S \subset \mathbb{R}^2$
  - Output: A simple partition of the convex hull of  $S$  into convex regions with vertex set  $S$
  - Goal: Minimize the number of regions
- 
- We got 4th place
  - Used Mixed Integer Programming

11 convex regions

## Coordinated Motion Planning:

- Input: Sets  $S, T \subset \mathbb{Z}^2$  of start and target locations for  $n$  robots and possibly a set of obstacles
  - Output: A sequence of movements for all robots from start to target avoiding collisions
  - Goal: Minimize the total time (makespan) or the total number of movements (energy)
- 
- 1st place in makespan category, 3rd place in energy category
  - Used storage network and conflict optimizer

## Partition Into Plane Graphs:

- Input: A graph  $G$  embedded in the plane with straight edges
  - Output: A partition of  $G$  into plane graphs
  - Goal: Minimize the number of partitions (colors)
- 
- We won 1st place
  - Best solution among all teams to every instance

## Greedy coloring: [MIT76]

- For each segment  $s$ :
  - $\text{color}[s] \leftarrow$  first valid color
  
- Order of the  $n$  segments is very important  
Optimal order always exists!
  
- May not be optimal even for 2 colors!

- Sorting by high to low degree is common  
Slow since all pairs of segments are tested
- Sorting by **angle** works well for the challenge  
Complexity still  $O(n^2)$ , but fast in practice
- **5.5** seconds for **74166** segments and **537** colors
- Since it is fast, we can run many times, for example with random starting angles
- **10** attempts take **55** seconds: **502** colors

3 colors produced by angle

- Greedy coloring with a dynamic choice of which segment to color next
- Color the segment that maximizes:
  - Number of **different colors crossed**
  - Break ties by number of crossings
- Optimal for bipartite, cycles, and wheels
- Complexity increases to  $O(n^2k)$  for  $k$  colors
- 90 seconds for 74166 segments and also got 502 colors

- Uses DSatur ordering to color segments
- Does not assign the first valid color
- Instead, colors a segment  $s$  with the valid color  $C$  that minimizes  $\text{area}(\text{hull}(C \cup \{s\})) - \text{area}(\text{hull}(C))$
- Uses the geometry of the instances
- Same complexity as DSATUR and barely slower
- 97 seconds for 74166 segments and 488 colors

## Squeaky Wheel: [JoDa98]

- Solve the problem using a certain order
  - Find elements that were not solved well
  - Move these elements **earlier** in the ordering
  - In the end, return the best solution found (not the last)
- 
- One way to do apply it to coloring:  
Move all elements with last color to the beginning of the list and repeat:  
Never increases the number of colors used
  - We did something different though

“The squeaky wheel gets the grease.”

## Bad:

- *Good* and *Bad* are two sets of segments **always ordered** by angle
  - Initially, all segments are *Good*
  - Greedy color *Bad* and then *Good*
  - Move segments with last color to *Bad* and repeat
- 
- Better than different starting random angles
  - Needs several ( $\sim 50$ ) repetitions
  - Number of colors may increase because *Bad* is sorted

- Goal: modify a given coloring to reduce the number of colors from  $k$  to  $k - 1$
- Partial coloring: a valid coloring of a subset of the segments

## Algorithm:

- Uncolor all segments of color  $c$
- While there is an uncolored segment  $s$
- Color  $s$  minimizing the “number” of conflicts
- Uncolor the conflicting segments

- Partial coloring: a valid coloring of a subset of the segments

## Algorithm:

- Uncolor all segments of color  $c$
- While there is an uncolored segment  $s$
- Color  $s$  minimizing the “number” of conflicts
- Uncolor the conflicting segments

- Goal: modify a given coloring to reduce the number of colors from  $k$  to  $k - 1$
- Partial coloring: a valid coloring of a subset of the segments

## Algorithm:

- Uncolor all segments of color  $c$
- While there is an uncolored segment  $s$
- Color  $s$  minimizing the “number” of conflicts
- Uncolor the conflicting segments

# Conflict Optimizer Details

- Uncolored segments are in a **queue**
- Let  $q(s)$  be the number of times a segment  $s$  is uncolored
- $weight(s) = 1 + q(s)^p$ , where  $p = 1.2$  is the default
- Minimize **sum of weights** of conflicting segments

Parameter analysis for  $p$  on an instance with 13806 segments

# Conflict Optimizer Improvements

- 1 Apply Gaussian noise of variance  $\sigma = .15$  to  $weight(s)$
- 2 Find a large clique and set the weight of its segments to  $\infty$
- 3 Iteratively remove segments of degree at most  $k - 2$  and color them later
- 4 Perform a bounded depth first search when coloring

Parameter analysis for  $\sigma$  on an instance with 13806 segments

# Scores

- 225 instances
- Each instance gets a score between 0 and 1, total score is the sum
- Starting from a score of 1, we lose 5% of the score for each 1% more colors compared to the best submitted solution
- We achieved a perfect 225 score

How much CPU core time (per instance) we need to win?

- We also worked on finding large cliques
- Useful as lower bounds and to improve algorithms by fixing the colors of the clique segments
- Used mixed integer programming, simulated annealing, branch and bound...

177

Clique with 177 segments out of 13806
